  Result
No.
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  NOTE: This is a 'working draft' sequence. It currently consists of 16 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
  as soon as it is available and the accession number will be preserved.

   Submitted (21-DEC-2000) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Dec 22, 2000 this sequence version replaced gi:11878435.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission
  Human DNA sequence from clone RP Xq21.33-22.3, complete sequence.
annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
  This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems such as compressions and repeats, but not necessarily within known
  corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

  Submitted (16-JUL-2000) Shugo Watabe, The University of Tokyo, Graduate School of Agricultural and Life Sciences; Yayoi 1-1-1 Bunkyo, Tokyo 113-8657, Japan
  Eukaryota; Metazoa; Chordata; Craniata;
Actinopterygii; Neopterygii; Teleostei;
Anguilloidei; Anguillidae; Anguilla.
  IMPORTANT: This sequence is not the entire insert of clone RP11-574A21 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true left end of clone RP11-274M8 is at 64052 in this sequence.
   Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chrx RP11-574A21 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
  Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping

  repeat_region
  where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: RMBL; Sw:, SWISSPROT; Tr:, TREMBL

This sequence is the entire insert of clone 173Dl. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
  Human DNA sequence f

  NOTE: This is a 'working draft' sequence. It currently consists of 43 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
  be preserved.

Submitted (14-OCT-1999) Whitehead Institute/MIT Center fo
Research, 320 Charles Street, Cambridge, MA 02141, USA
on Jul 3, 2000 this sequence version replaced g1:7329491.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html
  McEwan,P., McGurk,A., McKernan,K., McLaughlin,J., Meldrim,J., Morrow,J., Naylor,J., Norman,C.H., O'Connor,T., O'Donnell,P., Peterson,K., Pollara,V., Riley,R., Roy,A., Santos,R., Stange-Thomann,N., Stojanovic,N., Subramanian,A., Talamas,J., Tesfaye,S., Tirrell,A., Vassiliev,H., Vo,A., Wheeler,J., Wu,X Wyman,D., Ye,W.J., Zimmer,A. and Zody,M.
  * arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

COMMENT

```
JOURNAL
   Submitted (02-MAY 2000) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On Oct 22, 2000 this sequence version replaced gi:10305231. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)
   Tesfaye,S., Theodore,J., Tirrell,A., Travers,M., Trigilio,J., Vassiliev,H., Viel,R., Vo,A., Wilson,B., Wu,X., Wyman,D., Ye,W.J., Young,G., Zainoun,J., Zimmer,A. and Zody,M.
   http://ftp.genome.washington.edu/RM/RepeatMasker.html
  NOTE: This record contains 278 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.
  However, it should not be assumed that this clone will be sequenced to completion. In the event that
  the record

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternathemistry; an attempt was made to resolve all sequencing prob regions were double stranded or sequenced with an alternate sequencing problems,

repeat\_region repeat\_region repeat\_region

11271. .11381 /rpt\_family="L1" 12176. .12392

\_family="L1"

.11242

such as compressions and repeats; all regions were covered sequence from more than one subclone; and the assembly was confirmed by restriction digest. þу

Mapping information for this clone was provided by Dr. Michael Lovett, Departments of Otorhinolaryngology, Molecular Biology and Oncology, University of Texas Southwestern Medical Center, Dallas Tx. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc MAPPING INFORMATION:

SOURCE INFORMATION:
This clone is from the first BAC library from

Genome Systems,

Submitted (02-APR-1999) Joint Genome Institute, Lawrence Livermore Submitted (02-APR-1999) Joint Genome Institute, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA 94551, USA Map and sequence oriented from q centromere to telomere. Cosmid R34072 overlaps cosmid R28204 (AC006132) to the left from bases 1 to 2,155 of this accession, and overlaps cosmid R26955 to the right from bases 37,677 to 43,390. Additional chromosome 19 map and sequence information may be obtained at:

ttp://www-bio.lln1.gov/bbrp/genome/genome.html.
  Burkhart-Schultz, K.J., Gordon, L., Dias, J., Ramirez, M., Stilwagen, S., Phan, H., Velasco, N., Do, L., Regala, W., Terry, A., Garnes, J., Danganan, L., Erler, A., Christensen, M., Georgescu, A., Avila, J., Liu, S., Attix, C., Andreise, T., Trankheim, M., Amico-Keller, G., Coefield, J., Duarte, S., Lucas, S., Bruce, R., Thomas, P., Quan, G., Kronmiller, B., Arellano, A., Sanders, C., Ow, Nolan, M., Trong, S., Kobayashi, A., Olsen, A.S. and Carrano, A.V.   Zainoun, J., Zembek, L., Zimmer, A. and Zody, M.
  NOTE: This record contains 75 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone
  be
  will be sequenced to completion. In the event that the record is updated, the accession number will

   nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobhuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
  AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames I to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antitinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The

   alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

   Q
The present sequence encodes human sulphatase G (hSG). hSG is not a member of the well-characterised CTPSR sulphatase family. It belongs to a family showing sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenovora. The hSG gene contains 23 exons and is located at chromosome 17p11.2. The present sequence is clone lambda29.1 from a human testes cDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The cDNA insert we subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficience

   Eucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, LIM domain, AP2 and ERBBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements

   CC sucrose-isomaltase complex. The invention relates to purified compositions (I) that bind specifically to at least one of the gastro-intestinal (GI) tract receptors human intestinal compositions (EI) transporter (HPTI), hPEPTI, D2H and human compositions are used to active transport of complex (hSI). (I) provide active transport of complex (hSI). (II) provide active transport of compositions of the prevention of the prevention of the prevention of the prevention of the prevention of compositions, diabetes, osteoporosis, haemophilia, anaemia, cancer, composition, of angine pectoris. Specifically they are used to deliver compositions, or angine pectoris. Specifically they are used to deliver compositions, including genes or inhibitory nucleic acid, imaging agents are compositions. (I) may also provide targeting to the GI tract. Other uses of compositions (I) may also provide targeting to the GI tract. Other uses of compositions (I) may assay); and (ii) to screen for molecules that bind (I). Composition immunoassays. The antibodies are used to locate, detect and content of the composition of the content analysis.

   infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the pacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by DCR amplification for recombinant polypeptide production, e.g. in
  Chronic gastritis; duodenal ulcer disease; activator; inhibitor; bacterial life cycle; vaccine; immunisation; antisense; inhibition; cytoplasmic; Na+/H+ antiporter; Escherichia coli; ds.

  The present sequence encodes a Helicobacter pylori cytoplasmic CC protein, which was found to be homologous to Escherichia coli CC Na+/H+ antiporter protein following BLAST protein analysis.

CH. pylori has been strongly linked to chronic gastritis and CC are used to evaluate compounds, especially activators or inhibitors CC are used to evaluate compounds, especially activators or inhibitors CC inducted acid sequence. The nucleic acid sequences, and CC corresponding proteins, are also useful for generating vaccines for CC immunising subjects against H. pylori or for use in detecting the CC presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of CC a gene from Helicobacter species. H. pylori whole genomic DNA was CC isolated and nebulised to a median size of 2000 bp. Purified DNA CC fragments were blunt-ended and ligated to unique BstXI-linker CC adapters in 100-1000 fold molar excess. These linkers are CC complementary to the BstXI-cut pMPX vectors, while the overhang is CC concatemerise nor will the cut vector re-ligate itself easily. The CC concatemerise nor will the cut vector shift the 20 pMPX vectors to construct a series of shotqun subclone libraries. The purified CNA samples were then sequenced.

CC Note: The ORF/protein reference number for this sequence was construct a series of shotqun subclone libraries.

   The present sequence encodes a H. pylori cytoplasmic protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori

CC infection or to identify H. pylori polypeptide binding compounds,

CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from

CC overlapping contigs generated by mechanically shearing the bacterial

CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,

CC and the predicted coding regions defined by computer evaluation. To

CC identify likely H. pylori antigens for vaccine development, the amino

CC acid sequences predicted from various ORF were analysed for significant

CC conduction to other known or exported membrane proteins. Having identified

CC and determined the sequences of interest, particular regions can be

CC isolated from H. pylori by PCR amplification for recombinant polypeptide

CC production, e.g. in E. coli hosts.

  The new human secreted proteins are encoded by polynucleotides CC obtained from human placenta, adult testes, fetal kidney, fetal CC brain, adult brain, adult brain and adult blood cDNA libraries. CC The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritions in humans and animals. Suggested activities include nutritions in humans and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haematopolesis regulating activity, receptor/ligand activity, anti-inflammatory activity, activity, receptor/ligand activity, anti-inflammatory activity. The polynucleotides are also stated to be useful for gene therapy. The sequences are identified by a secretory leader sequence motif in the polynucleotide and it is thought that the encoded proteins have biological activity by virtue of their secreted chactribed in haxnagaga

   This sequence is the coding sequence for an example of the inhibitor of the invention (the encoded protein is not given in the specification). The inhibitor is a Kex2 proteinase family enzyme inhibitor with a molecular weight of 11,500. The inhibitor/protein (termed kexstatin) is expected to have pharmaceutical and pesticidal applications.

  This invention describes the construction of a novel insect cell vector (A) which contains a nucleic acid (I) that codes for a protein (II) of the DEAD-superfamily. (A), and recombinant insect viruses derived from them, are used to express recombinant (II), particularly RNA and DNA helicases. (II) are potentially useful for: (a) production of cell lines for research into cancer, inflammation and apoptosis, or for clarifying the mechanism of action of drugs, and (b) to identify pharmaceutical activity in known compounds, e.g. anticancer and antiviral activities. (II), which are difficult to express in bacteria and yeast, are expressed at high level in insect cells, e.g. 300-400 mg per 109 cells. This sequence encodes a human RNA-helicase p135 protein which is used in the description of the method of the invention.
  New insect cell vector containing the sequence encoding a DEAD-superfamily protein, particularly a nucleic acid helicase, used e.g. for identifying potential pharmaceuticals

  and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences AAA3204-A32096 with left and right flanking sequences. The polymcleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.

   and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences AAA32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.
AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST) sequences, corresponding to human secreted proteins. AAY64651 to AAX65438 represent the ESTs-related proteins corresponding to AAZ42265 to AAZ43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-criented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of
  also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used i gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ4264 and AAX66644 to AAX64650 represent

  The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-off primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included be used to obtain full length cDNAs with intact 5' ends and can therefore be used to obtain full length cDNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used
  different mRNAs in the particular tissue from which it was derived the appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
   used to obtain full length cDNAs and genomic DNAs. in diagnostic, forensic, gene therapy and chromosom They are used to obtain upstream regulatory sequences.

  detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia,

   also epilepsy. The isolated or a recombinant nucleic acid can also be used to distinguish between alleles of the corresponding gene. Cells and animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM, EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to diagnose FHM, EA-2, migraine and other neurological conditions
   flanking intronic sequences containing the complete coding region of the human calcium ion channel alpha 1 subunit gene and part of untranslated sequences. The channel is related to familial hemiplegic migraine (FHM) and/or episodic ataxia type 2 (EA-2) and is derived from, related to or associated with a gene present in humans on chromosome 19p13.1-13.2 The encoding gene can be used to localise or identify genes related to episodic neurological disorders, specifically migraine, FHM or EA-2, but

  The present sequence is one of 3351 sequences in a library of human complete polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as generated. The polynucleotides and their gene products are used as generated sequences (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia,

  clone GJ156, obtained from a Clontech human adult lung cDNA library.
The encoded 30-amino acid C-terminal peptide is identical to amino acids 121-149 of the composite TRAIN-R protein given in AM98146 and to amino acids 121-150 of the C-terminus of murine TRAIN-R short form (secreted protein, see AAM98144). The soluble protein is a sypressed at low levels in every tissue and cell line tested thus far, with higher expression detected in heart, prostate, owary, testis, peripheral blood lymphocytes, thyroid and adrenal covary, testis, peripheral blood lymphocytes, thyroid and adrenal cof inhibiting the binding of TRAIN-R to its ligand. A claimed method of treating, or reducing, the advancement, severity or effects of an immunological disease in a mammal comprises administering a pharmaceutical composition which comprises a TRAIN-R blocking agent, e.g. soluble TRAIN-R. TRAIN-R can be fused to an immunoglobulin to produce a fusion protein which may be targeted to various sites. It can be used in binding assays, and to identify antagonists and agenists. Anti-TRAIN-R antibodies can be used to reduce the

   fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagonising, inhibiting or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism, or with immunosuppressive disorders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otitis media, sinusitis, and

   The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigen. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remal cancer, colon cancer, gastric cancer, prostate cancer and

   lines and certian tumours of non-melanoma origins but not in normal cells except in testis. A first PCR fragment containing the last 18 bp and the initial 24 nucleotides of the MAGE-1 gene was generated and ligated to a second PCR fragment amplified from plasmid pTZ18RWAGE1 which contains the initial 546 bp of the MAGE-1 coding sequence. The terminal sequence of MAGE-1 was amplified and a fusion product was generated containing the H6 promoter and the full length MAGE-1 sequence. This construct may be introduced in to the poxvirus derived plasmids, ALVAC and NYVAC. The resulting viruses may be used in a composition for inducing an antigenic or immunological response, ie. for
  The sequences given in AAQ67865-66 represent expression cassettes containing the vaccinia H6 promoter and the human MAGE-1 gene which encodes human melanoma-associated antigen MZ2-E, in CP235 and pMAW037, respectively. These sequences were used in the construction of MYVAC-and ALVAC-based recombinant viruses containing the MAGE-1 gene. MAGE-1 is expressed in primary melanoma tumour cells, melanoma-derived cell

                                      be used to vaccinate against diseases such as rables, influenza and Newcastle Disease. It is particularly useful for immunising against cancers. The poxvirus (I) also provides a means of manipulating lymphocytes and tumour cells for use in cell-based immunotherapeutic modalities for cancer. (I) also have enhanced safety compared to unattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxvirus vaccines. This increased level of safety reduces the possibility of a 'runaway' infection in the host and reduces the chance of transmission from vaccinated to unvaccinated individuals and contamination of the environment. The present sequence represents a HE/MAGE-1 expression cassette and flanking regions from pMAW037

  NCI_CGAP_GC4 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. "
